

Usage of Innovative Pedagogical Technologies in Teaching Music

Xodjaeva Ziyoda Latipovna
Senior lecturer
Andijan State University

Annotation: One of the urgent tasks of our time is to educate the younger generation that meets intellectual, high moral and ethical standards, who loves their profession, who is knowledgeable, enthusiastic, professional, exemplary in equipping it with modern innovative pedagogical technologies.

The article describes the methods of using innovative technologies "Brainstorm" and "Boomerang", which can be used during the lesson. The teacher-musician educates the younger generation on the basis of such modern technologies as mature, spiritually pure, humane, meeting the requirements of the state and society.

Keywords: Innovative pedagogical technologies, brainstorming, mental abilities, handouts.

Preparation of highly qualified teachers who can be exemplary in educating intellectual young generation meeting superior spiritual, moral requirements, who love their profession, knowledgeable, unselfish, enhancement of their professional skills and arm them with modern innovative pedagogical technologies is one of the actual problems at present.

Teaching music has radically been renewed alongside with changes that have taken place in the educational system on the basis of requirements of "The law about education", "National Program of training personnel" of the Republic of Uzbekistan. Like in all other subjects, implementation of new State Educational Standards in teaching music enabled to completely use our national music inheritance, classic works, tunes, melodies, folklores, Uzbek National musical instruments, Russian and European peoples music together with Uzbek people's music.

Such opportunities of musical art are considered to be peculiar and exclusive sources in educating new generation. Moreover, interest for using new modern technologies during classes has been gradually growing at present, because pedagogical technologies and interactive methods help students think fast, improve their speech, work on themselves, investigate, achieve guaranteed goals using little efforts. Basic root of pedagogical technologies teaches young learners to think independently, read more books, work on themselves, respect each other's opinions, and behave properly in any situation.

That the modern pedagogical technologies are the main force in innovating the content of education system is scientifically and practically based. One of the peculiarities of pedagogical technologies is based on art of selflessness, enthusiasm and superior culture. Pedagogical technologies denotes art and skill. Pedagogical technologies are formed on the basis of several stages;

- Choosing the topic of a lesson in compliance with learners' needs;
- Management of learners' level of knowledge;
- Teaching learners how to identify their level of knowledge from themselves;
- Consolidation of the knowledge they obtained during lessons;
- Teaching them to think freely, express their opinions, prepare for lessons, make decisions working in groups;
- Teaching them to find solution of problems concerning the lessons;

There are the following needs set in front of each musical teacher to teach classes using modern pedagogical technologies. The teacher must have and improve his/her practical knowledge to use modern pedagogical technologies in musical class.

- Connecting the music with life by means of musical works;

- Developing investigative and thinking abilities by influencing learners' mental and spiritual status;
- Each teacher must be able to use live execution, handouts, computers, slides, multi-media means, CD's, tape recorders, magnetic tape-scripts and other technical means.
- During a musical class, the teacher should give out handouts to learners, put them in small groups and introduce game rules to them.

Groups should start doing the tasks looking into the handouts in front of them. For example: group 1 tries to find the name of the work, group 2- to identify the author of the work, group 3- to elucidate ideological content of the song. Learners do the tasks after they have listened to the song performed by the teacher.

Here, the teacher sets his/her objectives: what I want to teach them and what are the outcomes, the teacher does not give learners the ready-made material, but directs them to solve problems in the teaching materials, think critically and makes a point of developing their mental spiritual sides.

Innovative pedagogical technologies, i.e., interactive methods are divided in the following way: "Boomerang" technology:

This technology is aimed at having learners work with different books, texts during class, out-of-class, keep in mind the learned material, retell, freely express their opinions, learn a lot information in short time and the teacher – assessing all the learners during class.

"Brainstorming" method.

Brainstorming is a method that is used in working groups, developing many ideas. This is really such a method that enables learners to take active parts in class, state different ideas and at the same time involve others to interesting activity, work with high spirits and makes them motivated. That is why brainstorming is a main method of activation that it is impossible to work alone in it; a single idea involves all the participants in the group at the same time.

As a conclusion, we must say that musical teacher educates young generation as mature, spiritually pure humane meeting requirements of the government and society on the basis of such modern technologies.
