Annotation: In this article, the positive features of instilling educational lessons organized by pedagogues into the minds of students through modern methods and technologies, as well as their place in the development of society, are discussed.

Key words: education, method, project, design, technology, modern teaching methods, perfect person.

When a person comes into the world and begins to be formed as a person, he begins to receive education before receiving education, and during the time from birth to death, education is in harmony with a person, and during his life experiences and scientific research, he is further formed and polished. .

Education is a practical pedagogical process aimed at forming certain physical, mental, moral and spiritual qualities in a person; a set of measures taken to ensure that a person has the characteristics necessary for living in society. Education is the most ancient and eternal value that ensures the humanity of a person. Neither an individual nor a human society can exist without education. Because the values that ensure the existence of a person and society are passed from one generation to another only thanks to education. Education includes not only the educational work carried out in the family, school, children and youth organizations, but also the entire social system, its leading ideas, literature, art, cinema, radio, television, etc. It is worth noting that education is exists only in close connection with Because in the process of education and information acquisition, not only the knowledge of a person increases, but also the determination of moral and spiritual qualities is accelerated.

Education plays a crucial role in the life of any society and any country. A country that is not sufficiently involved in the education of the young generation, in general, members of society, is doomed to stagnation and crisis. After all, production of material and spiritual wealth in any society for its growth and development. should rise continuously. For this, the young generation must be able to produce material and spiritual wealth at the level of their ancestors, even better than them. In order to be able to form such material and spiritual abilities in the young generation, the society must have a system of educational activities that works continuously and effectively. Special attention is being paid to education classes in our country, taking into account aspects that are crucial for the fate of the future generation.

Nowadays, in modern pedagogy, there are dozens of classifications of education, some of which reflect practical tasks, some of which reflect only theoretical tasks. In order to achieve the intended goal in educational lessons, today, pedagogues should use effective methods and modern technologies wisely.

Methods depend on the purpose and content of education. The methods of education are aimed at forming the qualities of a well-rounded person. Therefore, taking into account the level of development of students is an important condition for the effective use of educational methods.

Pupils react differently to this or that educational influence. It depends on their special characteristics, the level of upbringing, the extent to which educational methods are chosen appropriately and effectively, and how skillfully they are used. The correct choice of educational methods helps to increase the activity of self-education of students in solving educational tasks positively.

It is appropriate to use educational methods taking into account the conditions, time, as well as their interaction with each other. Educational tools include the type of activity organized according to the purpose of education.

Games, educational work, sports and other types of activities are such tools. In addition, various subjects, examples of material and spiritual culture, information and technical tools are also used as educational tools in the educational process. For example, visual and educational tools, artistic and scientific literature, works of art, radio, television, computer, tape recorder, slides, as well as people can serve as educational tools.

The use of educational tools always requires the use of appropriate educational methods, because with their help, consciousness, emotions, and behavior are formed. Various activities of the student are organized.

Today, special attention is paid to the use of information and technical means in the educational process. Appropriate and effective use of them leads to spiritual growth of students.

Success in the modern world is largely determined by a person's ability to organize his life: setting goals, finding and attracting the necessary resources, developing a plan of action and analyzing whether the goals have been achieved by implementing it. Many studies conducted both in our country and abroad have shown that most of the modern leaders in politics, business, art and sports are people of project thinking type. Today, the school has all the opportunities to develop project thinking with the help of a special type of student activity - project activity.

The method of projects developed in the first half of the 20th century is becoming relevant again in the modern information society.

At this point, it is permissible to give brief information about the design method, which is considered one of the most effective methods, and the advantages of using it in education classes, distinguishing between educational methods and tools.

The project method is a set of techniques and methods that allow the creation of learning situations in which the student sets and solves his own problems, as well as the technology of accompanying the student's independent activity. A project is a set of actions specially organized by the teacher and carried out independently by children to solve a subjectively important problem of the student, ending with the creation of a product and its presentation as part of an oral or written presentation.

Design method. Students are independent and different according to their preferences obtaining necessary knowledge from sources; relying on the acquired knowledge teaches to solve scientific and practical problems. Forms communication skills and research skills by working in groups develops. Identifying problems, collecting necessary information, observing, conducting experiments, analyzing and summarizing skills forms.

Teaches students to think systematically.

1. In the spotlight

- helping the student to develop his creative abilities.

2. In order to increase the student's motivation to study, the educational process should not be based on the subject, but on the educational activity is based on

3. Each student's individual work pace in the project is their own ensures an increase in the level of development.

4. The general approach to the development of educational projects, combining the main physiological and mental functions of the student ensures its development.

5. Mastering basic knowledge with a deep understanding of them is different

allows for universal use in situations. Systematic activities of teachers and students. Teacher and students in advance, the stages of the project development in determining the systematic activity important to determine.

The project method has number advantages:

- allows to maintain a reasonable balance between theory and practice, to organize educational activities;
- successfully integrated into the educational process;
- easily adapts to the educational process. This technology makes it possible to achieve the goals set by any program, educational standard in any subject while preserving the achievements of our country's didactics, pedagogical psychology and private methods;
- this method is humanistic and ensures not only successful assimilation of educational material, but also intellectual and moral development of children, their independence, goodwill towards the teacher and each other;
- projects unite children, develop the ability to communicate, the desire to help others, the ability to work in a team and responsibility for joint work;
- allows to direct the attention of the student from the process of passive accumulation of knowledge to mastering different methods of activity in the conditions of the availability of information resources.

It can be used in any school discipline where a wide range of problems are solved, preferably for middle and high school students.

Teaching methods such as the project method play an important role in the process of professional self-education of schoolchildren.

Project activity is aimed at cooperation between teacher and student, development of creative abilities, it is a form of assessment in the process of continuous education, and it allows early formation of professional skills of students. The technology of the project is aimed at developing the personality of schoolchildren, their independence and creativity, and the organization of educational classes with the help of this technology is an important factor in the education of a perfect person who will selflessly serve the state and society in the future, as well as having good results for teachers and students.

Based on the above-mentioned considerations, the following conclusions can be drawn on the topic.

1. Since the basis of the educational process is formed by laws that reflect the objective requirements of social life, the social essence and nature of a person, conducting the educational process in a scientifically based manner requires a deep study of its laws.
2. The success of the educational process also depends on the principles of its organization. The principles of education are a set of basic ideas and rules that originate from the purpose of educating the young generation and determine the most important requirements for the content, methods and direction of educating a perfect person.
3. The methods used by the teacher in the organization of the educational process are also important, and they are determined by the tasks of raising the young generation to become a well-rounded, free, creative, independent thinker, which is set before the educational institutions by the social society.

In this process, the application of the design method in practice leads to a change in the role and function of the teacher. With this approach, the teacher works as a consultant, partner, organizer of the cognitive activity of his students. As a result, during the work on the project, the students acquire new knowledge and skills.
