Annotation: This article briefly discusses the fact that the system "Education - Science" is a system that is constantly enriched and developed in theory, practice, and its naturalness and purposefulness is a factor that accelerates the development of society, increasing its efficiency.

Keywords: Education, science, upbringing, spirituality, enlightenment, heritage man, youth.

Science is involved in all aspects of human activity, existence, especially in education. At the heart of the process of the modern education system is the scientific landscape of the world and scientific approaches to it. The role of science in education is reflected in its goals, principles, forms, methods, tools, results. Any education system is based on a certain scientific principle. In this, the nature of the state, the relationship between the individual and society in which he is educated, the role of the spiritual and moral environment is great. The educational process is the primary "field" that prepares the child for life, for his formation as a person. This is his first encounter with science.

Science influences the educational process in a purposeful way, and when necessary, it changes the education system. The principles of the scientific worldview are involved in the concepts, programs, thinking of teachers, in all aspects of the educational process. Education as a process is based on the achievements of a number of disciplines about man: anthropology, pedagogy, psychology, physiology, didactics, and has its own laws of information, educational technologies.

The whole educational process serves the interests of the individual and society. The formation of a modern personality type is not only to give him the available knowledge, but also to cultivate and cultivate the student's personality. Education is an integrative process. It involves all the elements of education, the preservation of educational values, their transmission from generation to generation, the formation of heuristics and curiosity in students, creativity and more. Education is a continuous process and is carried out systematically in special educational institutions - schools, academic lyceums, vocational colleges, institutes, universities. Man needs education throughout his life.

In the process of education, the unity of education and upbringing is formed on the basis of the best values of culture. In the process of education, a person is prepared for the social and professional roles he or she must play in social life. Changes in science and technology have a serious impact on the education system. It is impossible to increase the efficiency of science and technology in production without raising the quality and level of education.

Modern science pays great attention to the humanization, tolerance of the activities of educational institutions, the ratio of scientific and spirituality in them. The people who have matured in our land, who are well-known in the country, who are spiritually mature and perfect, have been scholars who have a high level of spirituality and enlightenment. They lit the lights of spirituality and enlightenment like a torch. Due to his high spirituality and enlightenment, Toron Zamin became famous on earth. Therefore, it can be said that at the present time the path of national maturity is the only way.

Spirituality and enlightenment are as necessary as water and air for the bright future of our people, our nation, our Motherland. The mutual unity and harmony of spirituality and

enlightenment, the conduct of our spiritual and enlightenment work together is a requirement of our development. They cannot be carried apart without being separated from each other. After all, education and upbringing need to be carried out in harmony, "because" the path to the human heart begins with education.

Only by ensuring their true harmony will it be possible to bring up a perfect person and ensure the independence and high development of our Motherland. The technical knowledge of our youth, the ability to master complex technologies must be accompanied by spiritual maturity, independent thinking. Mental intelligence and spiritual potential will be the two wings of our spiritual and enlightened youth.

It is no coincidence that our great enlightened ancestor Mahmudhoja Behbudi at the beginning of the last century called on the people of Turkestan to awaken their consciousness with the truthful thought: Today's age of high thinking and technology is also proving".

Indeed, if we do not deeply master secular science and technology today, if we only boast of our history, the discoveries of our distant ancestors and live in love with them, if we do not preserve, enrich and make a worthy contribution to this unique heritage, we will keep pace with the times. If we do not do this, it will be difficult for our people and our country to take a worthy place in the world arena.

Spirituality and enlightenment, we must never forget the saying in the hadiths, "Do not forget this world for this world and this world for the Hereafter." Because the experience of history and life, secular and religious values, knowledge and enlightenment have always complemented and enriched each other, it is on this basis that people have reached the peaks of spiritual maturity.

Among modern teaching methods, practical games, training, study of typical or non-typical situations, distance learning, information technology are becoming increasingly important.

To bring up a perfect person is to regularly summarize our achievements and shortcomings in education and upbringing, to draw the necessary conclusions, to strengthen the sense of responsibility in young people, to preserve the purity of the bio and social environment necessary for a healthy life, to form a worldview of struggle. it requires them to struggle with enlightenment, to form ideological immunity. The system "Education - Science" is a system that is constantly enriched and developed in theory and practice. Its naturalness and purposefulness are a factor that accelerates the development of society and increases its efficiency.
