Annotation: One of the fastest growing areas today is artificial intelligence. This article gives a brief overview of the assessment of human locomotor systems based on artificial intelligence. Today, information technology is developing rapidly in our lives.

Keywords: Artificial Intelligence, Deep Blue, IBM Computer.

The term “artificial intelligence” refers to the simulation of human mental processes through machines, especially computer systems. It also includes Expert Systems, Voice Recognition, Machine Visualization, and Natural Language Processing. how many tasks it can perform. The 1990s marked a new chapter in the development of artificial intelligence. In 1997, IBM's Deep Blue became the first computer in history to beat world chess champion Harry Kasparov. Artificial intelligence is the science and technology of creating smart machines, especially smart computer programs. Artificial intelligence is related to a task similar to the use of computers to understand human intelligence, but is not limited to biologically reliable methods.

Artificial intelligence is important because it can give businesses insights into their operations that they may not have known before, and in some cases, artificial intelligence can perform tasks better than humans. Especially when it comes to repetitive, detail-oriented tasks, such as analyzing a large number of legal documents to make sure that the relevant fields are filled in correctly, artificial intelligence tools often do things quickly and with relatively little error. ends with. This has helped increase efficiency and opened the door to completely new business opportunities for some large businesses. Before the current wave of artificial intelligence, it was hard to imagine using a computer program to connect drivers to taxis, but today Uber has become one of the largest companies in the world by doing just that. It uses sophisticated car learning algorithms to predict the likelihood that people will need to travel in certain areas, which helps to get drivers actively on the road as long as they need to. As another example, Google has become one of the largest players in a number of online services, using machine learning to understand how people use their services and then improve them. In 2017, Sundar Pichai, CEO of the company, announced that Google would operate as an “artificial intelligence company” in the first place. Today's largest and most successful companies use artificial intelligence to improve their operations and gain an advantage over competitors.

Whether artificial intelligence is useful or harmful, we will now briefly write about it. The various debates about artificial intelligence have been going on for almost 50 years. Experts are still divided on the issue. Some experts are concerned that mass unemployment could rise as a result of their popularity. Some experts say artificial intelligence should be treated positively.

According to Elon Musk, the founder of SpaceX, “Artificial intelligence is a major threat to human civilization. Artificial intelligence causes mass labor problems. Because robots can do everything better than we can. As a result of the pursuit of advanced technology, companies may lose sight of the dangers posed by artificial intelligence.”

Microsoft CEO Bill Gates also spoke out against him. "After a few decades, when robots start doing most of the work, SI becomes so powerful that eventually it starts to worry us. I agree with Snake Mask. But I don't understand why this question doesn't concern others," said Gates.

Based on the above, the role of artificial intelligence in our lives today is a bit misleading from year to year, it is deepening at a very high rate day by day. The debate over whether they are human successes or failures is long overdue. Most importantly, in the words of science fiction writer Ishak Azimov,

the motto of creating robots should not be to harm people. Artificial intelligence affects the future of almost every industry and every human being. Artificial intelligence has worked as a key driver of emerging technologies such as big data, robotics and IoT, and it will continue to act as a technology innovator in the near future
