

Renewal of the Culture of Thinking and Philosophical Reflections

Norov Said

Associate Professor of the Department of Social Sciences,
Candidate of Philosophical Sciences,
Samarkand State Architectural and Civil Engineering Institute (Uzbekistan).

Annotation: The article discusses the peculiarities of modern social development, the development of social consciousness and the deepening of humanity in the mysteries of the world, the renewal of the culture of thought and philosophical observation of the XXI century.

Keywords: man, philosophy, way of thinking, XXI century, development, universe, being, connection.

Considering the peculiarities of the modern period of human civilization, it is important to make a philosophical observation with a holistic knowledge of social development and the future. In this sense, the formation of a scientific and philosophical worldview about the surrounding world, its various manifestations, the origin of the Universe, the high value of life, the possibilities of existence, infinity and limitation is an urgent issue today.

A person realizes his immediate existence, his existence in constant contact with the surrounding world. In order to live in the world and adapt optimally, a person, his intellect and feelings are directed outside, that is, to the knowledge of the world. Since ancient times, people have studied the world around them, the meaning of things and phenomena in it, thought about their value and meaning. Over time, as society developed, the range of issues in this area expanded, and the importance of their solution increased.

A person realizes his immediate existence, his existence in constant contact with the surrounding world. In order to live in the world and adapt optimally, a person, his intellect and feelings are directed outside, that is, to the knowledge of the world. This is due to the fact that man's mastery of the world depends primarily on the solution of problems associated with its study. Accordingly, the natural, historical and social aspects of the human cognitive process are distinguished. The purpose and task of purposeful knowledge is the discovery of truth by identifying their deep, stable, defining sides and aspects, their essence, by studying various phenomena.

In the process of learning, human activity is aimed at creating innovations and productive work through various means. A person creates various tools and equipment based on knowledge, creates scientific theories, models, symbol systems, emblems, ideal objects, and so on. But at the same time, he pays special attention to the extent to which his abilities have the potential to understand the world, and what else he needs to do in order to achieve great results and achievements in this field.

The features of modern social development, the development of public consciousness and the deepening of humanity's familiarization with the secrets of the world are determined by the priority of the intellectual potential of the 21st century. In this sense, the formation of a philosophical worldview about the world and the phenomena of being is determined by the approach to the processes taking place in it on the basis of natural science knowledge.

In this sense, the definition of the methodological significance of the concepts and categories of philosophical sciences in human cognitive activity allows us to identify the following problems:

- reflect on the internal cause-and-effect relationships of what is happening in objective reality and events;
- the desire to draw clear conclusions that the events and processes taking place in the world are the result of the influence of internal and external factors;
- to have a firm idea that being before us is an internal reason, content, essence, external expression of possibility;

- have scientific knowledge about the existence of each object in a state of generality, specificity and integrity of individual features;
- be able to prove that the interdependence and interdependence of things and events can legitimately manifest itself as an internal necessity and causality;
- determine the methodological significance of the categories of philosophy in scientific knowledge.

It should be noted that the more philosophical generalizations about being, action, time, the more developed the culture of philosophical thinking in society. This corresponds to the culture of forming and proclaiming the beliefs of society and the individual. According to Islam Karimov: "Philosophy is the father of all sciences. A person who does not know philosophy, be it medicine or education, art or culture, does not understand the meaning of life and his profession".

In conclusion, it is important to give students a complete knowledge of the world and its existence, to make philosophical observations and creative use of them as a unique law that tells people how to master and change the world:

- ✓ as a result of the development of science and practice, dialectics has recently emerged as the science of the most general laws of nature, society and the development of thought, their connections and connections;
- ✓ all things, events and processes in existence are interconnected, interact and oppose each other in a common connection, require each other;
- ✓ the emergence of ideas about the variability of the world, the interdependence of things and events in it was a very qualitative change in the process of human cognition of the world;
- ✓ it helps to form a scientific scientific worldview among people, creating a real scientific picture of the world, giving us the right direction regarding the interrelationships and general patterns of development in nature, society and human thought, pointing out ways to master and change the world.
